Figure 1 Brain MRI findings of a 31-year-old woman with Wolfram syndrome

Axial T2-weighted image (A) and sagittal T1-weighted image (B) demonstrate atrophy of brainstem. Note absence of neurohypophyseal "bright signal" on sagittal T1 image (B). T2-weighted image (C) shows atrophy of cerebellum and hyperintense signal at ventral part of the pons.

A 31-year-old woman was diagnosed with type 1 diabetes mellitus (DM) at age 5 years and subsequently with hypothyroidism at age 16 years. She developed progressive visual loss at age 19 years and progressive hearing loss at age 28 years. She was clinically and radiologically diagnosed with Wolfram syndrome

(figures 1 and 2). Wolfram syndrome, first described in 1938, is a rare autosomal recessive disorder.¹ It features diabetes insipidus (DI), DM, optic atrophy (OA), and deafness (D) (DIDMOAD).^{1,2} It is caused by a mutation in the *WFS1* gene that encodes wolframin, a transmembrane protein of pancreatic β cells.¹

Figure 2 Optic nerve and optic tract findings

Axial fluid-attenuated inversion recovery image (A) demonstrates increased signal intensity in the bilateral peritrigonal areas/optic tracts. Coronal T2-weighted image (B) shows thinning/atrophy of bilateral optic nerves (arrows).

From the Department of Radiology (R.G.), Faculty of Medicine, Hacettepe University, Ankara; and the Department of Radiology (E.G.), Rize State Hospital, Turkey.

Go to Neurology.org for full disclosures. Funding information and disclosures deemed relevant by the authors, if any, are provided at the end of the article.

The life expectancy of patients diagnosed with this syndrome is about 30 years.

AUTHOR CONTRIBUTIONS

Rahsan Gocmen interpreted neuroradiologic aspects of this article including formatting of the figure and other professional comments, assisted in drafting, and revised the manuscript for intellectual content. Ezgi Guler wrote the draft, collected the information, compiled the manuscript, and assisted in drafting and preparing the manuscript for publication.

STUDY FUNDING

No targeted funding reported.

DISCLOSURE

The authors report no disclosures relevant to the manuscript. Go to Neurology.org for full disclosures.
