Cefepime-induced jaw myoclonus

Neurotoxicity resulting in reversible encephalopathy with myoclonus has been increasingly recognized as a complication of cefepime, especially in patients with renal insufficiency.^{1,2} We report 2 cases of jaw myoclonus (video on the *Neurology*[®] Web site at Neurology.org) that occurred within 48 hours of administration of cefepime. Both patients had preexisting renal insufficiency, and both experienced resolution of the myoclonus within 24 hours of discontinuation of the drug. Given the discomfort of jaw myoclonus and the inability to take oral nutrition as a result, rapid diagnosis and immediate drug discontinuation are crucial.
