Multifocal cerebellar liponeurocytoma

A 42-year-old man presented with a 3-year history of headache. Neurologic examination was unremarkable. Brain MRI showed multiple peripheral cerebellar nodules, some containing fat (figure). Biopsy revealed neurocytic cancer cells scattered with mature fat tissue. The approach was conservative with serial imaging follow-up. Cerebellar liponeurocytoma is a rare tumor classified as grade II by the World Health Organization, now considered a clinicopathologic entity distinct from medulloblastoma. It is almost always solitary and almost always cerebellar. The clear multifocality of the MRI findings makes this case unusual.

Thiago Luiz Pereira Donoso Scoppetta, MD, Mariana Carneiro Barbosa de Brito, MD, José Luiz Masion de Almeida Prado, MD, Luiz Carlos Donoso Scoppetta, MD

From the Department of Radiology, Hospital São Camilo Pompéia, São Paulo SP, Brazil.

Author contributions: Dr. Thiago Scoppetta and Dr. Brito performed the data collection and drafted the manuscript. Dr. Prado made the radiologic diagnosis. Dr. Luiz Scoppetta contributed the study concept and revised the manuscript.

Study funding: No targeted funding reported.

Disclosure: The authors report no disclosures relevant to the manuscript. Go to Neurology.org for full disclosures.
