clear that data on sICH were available from 97 (not 98) control patients.³

Author Response: Ching-Jen Chen, Dale Ding, Robert M. Starke, Kenneth C. Liu, Andrew M. Southerland, Bradford B. Worrall, Charlottesville, VA: We appreciate the comments by Tsivgoulis et al. on our review.¹ With regards to the all-cause mortality in the SWIFT PRIME trial, although table 2 reported mortality in 12 of 97 patients at 90 days in the control group, the data for final assessment at 90 days were only available in 93 patients.³ This is evident in figure e-2 and reflected in figure 1 of the original publication.³ Therefore, the final assessment of mortality should be 12 of 93 patients at 90 days.

We agree with Tsivgoulis et al. that the result of symptomatic intracranial hemorrhage in the SWIFT PRIME trial should be 3 of 97 patients in the control group. We thank the authors for bringing this error to our attention and are grateful for the opportunity to rectify the data.

CORRECTION
Endovascular vs medical management of acute ischemic stroke
In the article “Endovascular vs medical management of acute ischemic stroke” by C.-J. Chen et al. (Neurology 2015;85:1980–1990), there is an error in figure 1, panel C. The total number of patients in the “Medical Management” group for the SWIFT PRIME trial should read 97, rather than 98 as originally published. The authors regret the error.
