Author Tip

Neurology has recently adopted the following policy in support of the movement to promote data transparency: "Data not provided in a neurology article because of space limitations must be made available in a trusted data repository or shared at the request of other investigators for purposes of replicating procedures and results." *Neurology* has created a mechanism for editors and peer reviewers to review data deposited in the Dryad public repository at the time of manuscript submission. Authors will pay a nominal fee for depositing data in a public repository (waivers exist for submissions from authors based in countries classified by the World Bank as low- or middle-income economies).

Living in a sunnier climate as a child and young adult may reduce risk of MS

People who live in areas where they are exposed to more of the sun's rays, specifically UVB rays, may be less likely to develop multiple sclerosis (MS) later in life. Exposure in childhood and young adulthood may also reduce risk. "While previous studies have shown that more sun exposure may contribute to a lower risk of MS, our study went further, looking at exposure over a person's life span," said study author Helen Tremlett, PhD, of the University of British Columbia in Vancouver, Canada. "We found that where a person lives and the ages at which they are exposed to the sun's UV-B rays may play important roles in reducing the risk of MS."
