Notable from Our Podcast

The December 12 featured interview is about immunotherapy treatment in new-onset refractory status epilepticus. For the “What’s Trending” feature of the week, an update from the Resident & Fellow section as well as a discussion on gait freezing and gait disorders was provided.

Author Tip

A hybrid open access (OA) option is offered to authors whose full-length articles or reviews have been accepted for publication (not all manuscript categories are eligible for this option; please contact the Editorial Office for details). Authors submitting work to *Neurology* will be given the opportunity to select the OA option at the revision stage of the peer review process, contingent upon acceptance of the paper. This choice has no influence on the peer review and acceptance processes. These articles are subject to the standard peer review process and will be accepted or rejected based on their merit. Article Processing Charge depends on the type of funding. For more information, see neurology.org/open-access/neuro/faq.

Exposure to terror may increase risk of migraine, other headaches

Survivors of a terror attack have an increased risk of frequent migraine and tension headaches after the attack. “We know a lot about the psychological effects of terror attacks and other extreme violence on survivors, but we do not know much about the physical effects of these violent incidents,” said study author Synne Øien Stensland, MD, PhD, of the Norwegian Centre for Violence and Traumatic Stress Studies in Oslo. “Our study shows that a single highly stressful event may lead to ongoing suffering with frequent migraines and other headaches.”

Stensland SØ, Zwart JA, Wentzel-Larsen T, Dyb G. The headache of terror: A matched cohort study of adolescents from the Utøya and the HUNT Study. *Neurology* 2018;90:e111-e118.
