Is there a link between diabetes and Parkinson disease?

People with type 2 diabetes may have an increased risk of having a diagnosis of Parkinson disease later in life. In addition, the risk may be higher for younger people and those with complications from the disease. “Our study examined data on a large portion of the English population and found a strong link between these 2 seemingly different diseases,” said study author Thomas T. Warner, FRCP, PhD, of University College London in the United Kingdom. “Whether it is genetics that may play a role in the development of these diseases or they have similar pathways to development needs to be investigated further.”
