Neurology® 2019;92:723-724. doi:10.1212/WNL.0000000000007273

Figure 1 MRI brain

A 54-year-old woman with a large right petroclival meningioma (figure 1) reported spontaneous spinning vertigo, oscillopsia, and right-sided “clicking” tinnitus lasting 5–30 seconds, recurring every 5–10 minutes. Examination with video-Frenzel goggles revealed flurries of spontaneous right-beating, horizontal-torsional (irritative) nystagmus, time-locked with vertigo (video 1). Hearing was symmetrical with right vestibular hypofunction affecting all 3 semicircular canals and the saccule (figure 2). Vestibular paroxysmia was diagnosed and carbamazepine 100 mg BD was prescribed. The patient was asymptomatic at 4 weeks. Eighth cranial nerve neurovascular cross-compression may cause vestibular paroxysmia characterized by brief spells of spontaneous and positional vertigo associated with unilateral audiovestibular deficits.1,2

Author contributions
Allison Young: acquisition of data, original figure illustrations, revised and approved the manuscript for intellectual content. Benjamin Jonker: acquisition of data, reviewed the clinical case, revised and approved the manuscript for intellectual content. Miriam Welgampola: acquisition of data, reviewed the clinical case, revised and approved the manuscript for intellectual content.

Study funding
This research was funded by the Garnett Passe and Rodney Williams Memorial Foundation and the National Health and Medical Research Council of Australia. These

From the Institute of Clinical Neurosciences, Central Clinical School (A.S.Y., M.S.W.), and Central Neurosurgery, Brain & Mind Centre (B.J.), Royal Prince Alfred Hospital, University of Sydney, Australia.
