About the *Neurology* Resident & Fellow Section

This section, developed for the trainee readership, will keep you up to date on issues related to training and career considerations as well as support the development of lifelong learning skills. This section is trainee-run; a team of residents and fellows is responsible for writing, reviewing, editing, and publishing articles of interest to trainees. The group is also responsible for initiating and developing other unique projects, including podcasts, electronic communications, the Resident & Fellow website, and new subsection ideas. Weekly e-Pearls, or e-mail "pearls," have been sent to residents nationwide since July 2008. An archive of e-Pearls can be found at NPub.org/epearls.

People with dystonia and spasticity may become immune to botulinum toxin treatment

People with disorders that cause muscle tightness and contractions can get relief from treatment with botulinum toxin. But a new study shows that about 15% of people treated with botulinum toxin type A for dystonia or spasticity can develop an immune response to the treatment itself, which can make the treatment less effective or stop working entirely. "People may be able to lessen their chances of developing this response by making sure the dose of the drug in each injection is as low as possible, the time between injections is not shortened, and booster injections are avoided," said study author Philipp Albrecht, MD, of Heinrich Heine University in Düsseldorf, Germany.
