Author Tip

A hybrid open access (OA) option is offered to authors whose full-length articles or reviews have been accepted for publication (not all manuscript categories are eligible for this option; please contact the Editorial Office for details). Authors submitting work to Neurology will be given the opportunity to select the OA option at the revision stage of the peer-review process, contingent upon acceptance of the paper. This choice has no influence on the peer review and acceptance processes. These articles are subject to the standard peer-review process and will be accepted or rejected based on their merit. The article processing charge depends on the type of funding. For more information, please see NPub.org/OAFAQ.

**Beware of swimming if you use deep brain stimulation for Parkinson: Case studies show good swimmers lose ability when device is on**

Researchers have identified 9 cases of people who lost their ability to swim after having a deep brain stimulation device implanted to control symptoms of Parkinson disease. All 9 people had been good swimmers even after their Parkinson disease diagnosis. But once they had deep brain stimulation surgery, researchers found while other movement symptoms improved, their swimming skills deteriorated. “Until more research is done to determine why some people with deep brain stimulation can no longer swim, it is crucial that people be told now of the potential risk of drowning and the need for a carefully supervised assessment of their swimming skills before going into deep water,” said author Daniel Waldvogel, MD, of the University of Zurich in Switzerland.
