A 50-year-old man with facioscapulohumeral muscular dystrophy 1 (FSHD1), scapulooperoneal weakness, and bilateral scapular winging presents a downward movement of his umbilicus while attempting to get up from the recumbent position (video 1). Beevor sign, an upward umbilicus deviation when the supine patient is flexing the neck or tries to sit up without the use of the hands, indicates lower abdominal muscle weakness. It is highly sensitive and specific, but not diagnostic, for FSHD1, because it is described in other myopathies.^{1,2} Beevor sign may be present in this “inverted” form, indicating predominant weakness of upper rectus abdominis muscle.

Study funding

No targeted funding reported.

Disclosure

The authors report no disclosures relevant to the manuscript. Go to Neurology.org/N for full disclosures.

Appendix Authors

Name	Location	Contribution
Constantinos Papadopoulos, MD, PhD	First Department of Neurology, Eginition Hospital, Medical School, National and Kapodistrian University of Athens, Greece	Design of the study, analysis and interpretation of the data, drafting manuscript, multimedia files creation
Sofia Xirou, MD, PhD	First Department of Neurology, Eginition Hospital, Medical School, National and Kapodistrian University of Athens, Greece	Analysis and interpretation of the data, revising the manuscript
Evangelia Kararizou, MD, PhD	First Department of Neurology, Eginition Hospital, Medical School, National and Kapodistrian University of Athens, Greece	Analysis and interpretation of the data, revising the manuscript
George K. Papadimas, MD, PhD	First Department of Neurology, Eginition Hospital, Medical School, National and Kapodistrian University of Athens, Greece	Analysis and interpretation of the data, revising the manuscript
