April 6, 2021, Issue

This issue covers a range of topics in child neurology. The Child Neurology article reminds us that late reactivation of herpes simplex virus (HSV) encephalitis can occur. The Pearls & Oy-sters stresses the value of early recognition of medial medullary syndrome aided by nystagmus evaluation to expedite thrombolytic therapy. This and the Video Teaching NeuroImage demonstrate important tips in eye movement evaluation in children. The Teaching NeuroImage teaches the value of brain imaging in cases of congenital muscular dystrophy.

**Child Neurology: Intractable Epilepsy and Transient Deficits in a Patient With a History of Herpes Simplex Virus Encephalitis**

Reactivation of HSV encephalitis may occur years after initial illness. Neurologists should be aware that although most cases of HSV reactivation occur within the first year of initial infection, late reactivation in the setting of physiologic stress may occur.

**Pearls & Oy-sters: Upbeat Nystagmus and Quadriplegia in a Young Girl With Bilateral Medial Medullary Syndrome**

Upbeat nystagmus differentiates a high cervical cord from a brainstem lesion in an acutely quadriplegic patient. An excellent clinical video illustrates the characteristics and topography of vertical nystagmus.

Page e1921

**Teaching NeuroImages: An Imaging Clue in a Boy With Developmental Delay**

Characteristic neuroimaging findings in the brain are seen in patients with a-dystroglycanopathy variant of congenital muscular dystrophy. This case reinforces the relevance of CNS imaging in patients with muscular dystrophy and developmental delay.

Page e1925

**Teaching Video NeuroImages: Atypical Abnormal Eye Movements in PNPO-Related Epilepsy**

Neurologists should be aware of the newly described symptomatology of PNPO-related epilepsy, which presented in an infant with nonepileptic, paroxysmal abnormal eye–head movements.

April 13, 2021, Issue

This issue covers a range of topics from bread and butter neurology to rare conditions and training pathways. The Education Research article provides national needs assessment data on the barriers to pursuing neurointerventional training for neurology residents. The Pearls & Oy-sters article is an excellent and concise review of the differential diagnosis of pupillary anisocoria. The 2 Teaching NeuroImage cases illustrate how to approach the ocular examination in patients with suspected neuroinfectious diseases.

Education Research: Challenges Faced by Neurology Trainees in a Neuro-Intervention Career Track
Neurology graduates face challenges in carving a niche in the field of endovascular neurology. These authors report that lack of early exposure and a clear training pathway are barriers to entry for trainees interested in neurointervention.

Pearls & Oy-sters: Anisocoria Greater in the Dark: It’s Not Just All About Horner Pupil
A careful pupillary examination including pharmacologic testing is critical in evaluating patients with pupil asymmetry and may help to avoid unnecessary imaging workup in patients with Adie tonic pupil.

Teaching NeuroImages: Hutchinson Sign in Herpes Zoster Ophthalmicus
The presence of herpetic skin lesions along the nasociliary nerves of the nose is a predictor of ocular complications of herpes zoster ophthalmicus.

Teaching NeuroImages: Neurocysticercosis With Unilateral Vision Loss
Subretinal cysticercosis is a rare ocular manifestation of neurocysticercosis and may present with unilateral vision loss. This case illustrates the fundus findings, ocular ultrasound, and brain imaging features in this case.

April 20, 2021, Issue

In this issue, the Journal Club article critiques the limitations of retrospective clinico-radiographic correlation studies including selection of optimal controls. The Pearls & Oy-sters article presents a unique case of CNS lymphoma in pregnancy and discusses important aspects of neurologic care in the pregnant patient. The Teaching NeuroImages demonstrate the mechanisms of mechanical factors in the pathophysiology of glossopharyngeal neuralgia and nystagmus in patients with Ménière disease.

Journal Club: Diffusion-Weighted MRI in Transient Global Amnesia and Its Diagnostic Implications
A recent article published in Neurology proposes the addition of MRI-based diagnostic criteria to existing clinical criteria for diagnosis of transient global amnesia. This journal club reminds us of the importance of interpreting these data in the context of limitations in optimal controls for this retrospective study.

Pearls & Oy-sters: Primary CNS Burkitt Lymphoma in Pregnancy: Management Challenges of a Rare Entity
Primary CNS Burkitt lymphoma may rarely occur during pregnancy and can be difficult to treat. The authors discuss the diagnostic workup, treatment challenges, and why this may occur during pregnancy.

Teaching NeuroImages: Glossopharyngeal Nerve Focal Pressure Atrophy in Glossopharyngeal Neuralgia
In patients with glossopharyngeal neuralgia, objective evidence of vascular compression is rare, but in this case was associated with resolution of symptoms after decompression. Striking intraoperative imaging illustrates focal pressure atrophy of the nerve.

Teaching Video NeuroImages: Spontaneous Nystagmus Reversal in Acute Attack of Ménière Disease
Neurologists and trainees should be aware of video-nystagmography. In this case, the authors recorded 2 phases of nystagmus in Ménière disease—irritative (ipsilateral) and paralytic (contralateral)—allowing the observer to see unique aspects of this patient’s nystagmus and learn how to define and correlate the phases.

April 27, 2021, Issue

This issue covers several topics important for trainees and neurologists. The Education Research article presents data from a national survey on the status of EEG training in US neurology residency programs. Rare CNS involvement in Hodgkin lymphoma is presented in the Pearls & Oy-sters highlighting how to approach CNS imaging in patients with history of cancer. The Teaching Video NeuroImages demonstrate characteristic breathing and speech findings in patients with brainstem syndromes.
COVID-19 and Neurologic Disease: Call for Papers!

The editors of Neurology are interested in papers that address the neurological aspects of COVID-19 infection and challenges to the management of patients with chronic neurological conditions who have, or are at risk for, the infection. Relevant papers that pass initial internal review will undergo expedited peer review and online publication. We will consider papers posted in preprint servers. Submit observational studies and clinical trials as Articles and case series and case reports under the Clinical/Scientific Notes category to https://submit.neurology.org/ today!
