Figure Structural MRI and PET/MRI

(A) Structural MRI T1-3D sequence, showing bilateral parieto-occipital and temporal cortical atrophy (arrows) with enlargement of lateral ventricle's posterior horns (*). (B) 18-FDG PET/MRI showed profoundly impaired posterior cortical metabolism, especially in the parietal and parieto-occipital association cortices (arrows), with relatively preserved metabolism in the primary visual cortex (*).

Abstract

We present the case of a 68-year-old woman who developed progressive visuospatial deficits in a period of 18 months, leading to the loss of her independence for activities of daily living. After examination, she showed signs of Balint syndrome with optic ataxia, oculomotor apraxia, and simultanagnosia without visual acuity impairment. After brain imaging showing severe bilateral parieto-occipital association cortex atrophy, a diagnosis of posterior cortical atrophy was made according to the 2017 International Consortium's criteria.

A previously healthy 68-year-old woman developed visuo-spatial deficits, inability to read, and motor dyspraxia for 18 months, leading to the loss of her independence despite spared memory and speech. Several ophthalmology consultations showed no findings. Neurologic examination evidenced oculomotor apraxia, optic ataxia, and simultanagnosia (video 1). Neuroimaging showed cortical atrophy with impaired metabolism on both occipito-parietal association cortices but preserved the primary visual cortex (figure).

Posterior cortical atrophy is a rare variant of Alzheimer disease but can also occur in other neurodegenerative disorders such as corticobasal degeneration.¹ Other causes for Balint syndrome such as PRES or watershed infarcts should be ruled out.²

Acknowledgment

The authors thank Dr. Nora Estela Kerik Rotenberg (Instituto Nacional de Neurología y Neurocirugía, Chief of Department of Molecular Imaging) and Dr. Leo Bayliss-Amaya (Instituto Nacional de Neurología y Neurocirugía, Neurology Department) for their administrative direction, analysis assistance, and invaluable teachings.

Study Funding

No targeted funding reported.

Disclosure

The authors report no disclosures relevant to the manuscript. Go to [Neurology.org/N](https://www.neurology.org/N) for full disclosures.

Appendix Authors

Name	Location	Contribution
Roberto Rodríguez-Rivas, MD	Instituto Nacional de Neurología y Neurocirugía CMDX, Mexico	Designed and conceptualized the study; drafted the manuscript for intellectual content; and edited videos, images, and redacted video vignettes
Mariana Marcín-Sierra, MD	Instituto Nacional de Neurología y Neurocirugía CMDX, Mexico	Data and video collection and analysis
Carlos Cardeña-Arredondo, MD	Instituto Nacional de Neurología y Neurocirugía CMDX, Mexico	Coordinated imaging and molecular analysis
