Abstract

Women’s Neurology is an emerging subspecialty that focuses on neurologic disorders across a woman’s lifetime. This new domain recognizes that both health and disease are directly impacted by hormonal and reproductive changes throughout the lifespan. This field includes neurologic diseases with a higher prevalence in women, as well as diseases that require specialized management during pregnancy, postpartum, lactation, and menopause. A survey was sent to United States neurology residency program directors to understand the state of training in the area. Their responses highlighted an urgent need for additional education in this field for neurology residents. Here, we discuss the educational gaps in this area, the clinical benefits of a women’s neurology discipline, the instructional gaps in this area, and provide practical recommendations for training programs in women’s neurology using two innovative fellowship programs.

An Overview of Women’s Neurology

Women’s Neurology is an emerging subspecialty that focuses on neurologic disorders across a woman’s lifetime. Key time periods span pregnancy, postpartum, and menopause, as well as considerations regarding family planning, fertility, bone health, and use of hormonal contraception, replacement therapy (HRT) or assisted reproductive technology, which all require a different management approach in patients with neurological disease. Neurologists have recognized important obstetric and sex-specific considerations in clinical practice for many years. Yet, there remain clear gaps in the educational opportunities for neurology residents who care for these populations, as well as for neurologists who want further expertise in this area following residency.
The care of women with neurological disorders during the peripartum period requires prompt specialized care coordination and management. Cisgender, transgender, and non-binary patients may all require obstetrical neurologic care. Neurologists who care for patients during pregnancy face a wide array of clinical concerns including drug safety and metabolism, the effect of pregnancy on neurologic disease activity or trajectory, safety of anesthetic and delivery modes, and how the underlying neurologic disease may increase risk of pregnancy complications. Peripartum neurological care spans outpatient and inpatient environments, and may require coordination across disciplines for a safe pregnancy, labor, and delivery. The peripartum period is also associated with an increased risk of several neurologic emergencies, including eclampsia and stroke. The number of pregnant patients is expected to grow with an increased rate of pregnancy among older women, who also have a greater risk of peripartum neurologic complications. Expertise in the complex management of these disorders is paramount for ensuring best outcomes for both the mother and baby.

Here, we describe gaps in neurology residency education and the opportunities for novel educational initiatives focused on women’s neurology. We also discuss why subspecialists cannot completely fill this gap and how training in general neurology on sex- and gender-informed neurologic care can provide the needed expertise, which we highlight using practical models of two existing women’s neurology fellowship programs.
Defining the Gap in Neurology Residency Training

A survey was sent in 2019 to all US neurology residency program directors to understand their perception of how well their residents were educated in caring for women with neurologic disease (Table 1). This survey was used as a surrogate measure to query program directors to discover if they felt a training gap existed; the number of lectures focused on a particular area was one measure of the perceived importance of that topic. The University of California, San Francisco Institutional Review Board approved this survey (IRB 19-27502) and written informed consent was obtained from all respondents. Of the 85 program directors who began the survey, 25 of them (35%) completed the survey. They were collectively responsible for training 704 neurology residents.

Only 44% of the residency program directors felt that their residents were adequately prepared to care for pregnant women with neurological diseases. In the year prior to the survey, 28% of the programs had no lectures focused on the care of women with neurological illness. Further, 56% of the residency program directors identified this as an area where residents were not adequately trained. The defined barriers to incorporating such didactics were lack of time, lack of expertise, and/or a lack of educational materials. Both a directed residency curriculum with educational materials to support core competencies and fellowship training would address these limitations. While lectures capture only a minute portion of the learning that occurs in residency, even in programs with an abundance of obstetric consults, dedicated faculty, and highly motivated residents, residency program directors acknowledged that there is room for improvement in this arena.
The national program requirements from the Accreditation Council for Graduate Medical Education (ACGME) include caring for patients with neurological disorders “across the lifespan,” but do not specifically require experience in treating pregnant and postpartum patients. Caring for women with neurologic disease is an important residency competency and warrants explicit attention. However, new educational initiatives require significant resources, including time and content expertise, which are not always available. There are several ways to incorporate women’s neurology education and assessment into graduate medical education depending on the program. These include self-study using published resources, formal residency didactics, and attending national conferences. Patient examples cared for in outpatient and inpatient settings can be highlighted in clinical conferences. A curriculum could be created on a national level through the American Academy of Neurology (AAN) and be available to all residency programs. Further, incorporating women’s neurology into an ACGME Neurology Residency Milestone would emphasize the importance of the issue.

Women’s Neurology Fellowship – A Novel Training Approach

National organizations have called for the consideration of social determinates of health, lifespan approaches, and cultural considerations in women’s health to optimize the clinical care of women. Fellowship training specific to women’s health is a trend seen in other areas of medicine, such as in internal medicine (e.g., cardio-obstetrics) and psychiatry (e.g., reproductive psychiatry). This nuanced training makes personalized sex- and gender-specific care attainable. There is a similar need for training neurologists to become experts in the care of women with neurological diseases, especially during the peripartum period, which can be aimed at providing general neurologists with this expertise.
The goal of a fellowship program in women’s neurology is to focus on issues specific to women with neurological disease. Training emphasizes sex differences in neurological disorders during all stages of women’s lives through multidisciplinary models of care. This fellowship may attract medical students to neurology interested in women’s health who might have instead chosen internal medicine or obstetrics. It also provides an area of expertise to aid academic promotion for general neurologists through education leadership and primary research. Indeed, such expertise is key to advancing research involving pregnant patients, who are often excluded from studies, which in turn results in lack of data in the management and outcomes of many neurologic disorders during pregnancy. Training in sex-informed patient care benefits patients, neurology departments, and the field of neurology at large.

Many subspecialties have areas of expertise in women’s health, including those specializing in epilepsy, headache, stroke, and multiple sclerosis. However, not all topics fall into these domains and so general neurologists with expertise in women’s neurology who can coordinate care across several disciplines, are also needed. The general neurology expert would act as a crucial hub connecting subspecialists and contribute to a team care model.

**Women’s Neurology Fellowship Program Models**

The University of Pittsburgh began a two-year Women’s Neurology fellowship training program in 2016. The women’s neurology fellow works at Magee Women’s Hospital where over 11,000 deliveries occur annually. The first fellowship year may be spent in an accredited program in clinical neurophysiology or epilepsy to address the need for expertise in peripartum epilepsy management. The second year begins with immersion into obstetrics where the fellow rotates
with the antepartum maternal fetal medicine, high-risk obstetrical, and obstetrical anesthesia services. The fellow consults on inpatient obstetrical patients with neurologic disorders and follows peripartum patients in several outpatient subspeciality clinics.

The one-year Women’s Neurology Fellowship program at Massachusetts General and Brigham and Women’s Hospitals began in 2018. This predominantly outpatient fellowship focuses on management of sex specific neurologic issues across the lifespan. This is accomplished by a core set of longitudinal ambulatory clinics in several subspecialties with expert preceptorship. This clinic experience is supplemented by two months of electives including women’s mental health, obstetrical anesthesia, maternal fetal medicine, urogynecology, and genetic counseling.

These two fellowships are distinct in organization but unified in overall educational goals. The University of Pittsburgh’s fellowship is focused on peripartum neurological care, training neurologists to provide expertise at centers lacking subspecialists. In contrast, the Massachusetts General and Brigham and Women’s Hospitals fellowship takes broad approach to sex-based concerns across a woman’s lifespan, providing an academic tract for general neurologists to pursue interests in women’s health. Both programs provide protected time and mentorship for educational and research pursuits. The goals of these fellowships are to train general neurologists to be experts in women’s neurology and serve to coordinate neurologic care with subspecialists both within neurology as well other health care providers as many of these women have complex needs.
Future Directions

A greater emphasis on caring for women with neurological disorders in neurology graduate medical education is imperative for maximizing health outcomes for these complex patients. Neurologists trained in women’s neurology offer a unique skillset to become leaders in the field through creating innovative interdisciplinary clinics, new educational initiatives for trainees, and advancing research. Post-graduate training offers unique opportunities for both provider and patient satisfaction. As fellows matriculate from these programs, it will be important to measure how their expertise enhances resident education at their local institutions. Clinical outcomes and patient satisfaction when cared for by women’s neurology specialists must be measured. Changes in the number and type of patient referrals at institutions that provide such expertise should be assessed. We anticipate that trainees will choose a career path in women’s neurology and that this will become a crucial part of academic neurology departments across the country.
